ABSTRACT

Aim: Quercetin is a strong antioxidant and long-term treatment of STZ-diabetic animals and it has been shown to reduce oxidative stress. Enhanced oxidative stress and changes in antioxidant capacity are considered to play an important role in the pathogenesis of chronic diabetes mellitus. Methods: Wistar male rat (n=40) were allocated into three groups, control group (n=10) and Quercetin (QR) group that received 15mg/kg (IP) QR, (n=10), and Diabetic group that received 55mg/kg (IP) streptozotocin (STZ) (n=20) which was subdivided to two groups of 10; STZ group and treatment group. Treatment group received 55mg/kg (IP) STZ plus15mg/kg QR, daily for, 4 weeks, respectively; however, the control group just received an equal volume of distilled water daily(IP). Diabetes was induced by a single (IP) injection of streptozotocin (55mg/kg) . Animals were kept in standard condition. In 28day after inducing diabetic 5cc blood were collected for TAC, MDA and Ox-LDL levels and kidney tissues of Rat in whole groups were removed then prepared for Apoptosis analysis by Tunel method. Results: Apoptotic cells significantly decreased in group that has received 15mg/kg (IP) Quercetin (P<0.05) in comparison to experimental groups (P<0.05). Conclusion: Since in our study 15mg/kg (IP) Quercetin have significantly Preventive effect on kidney cells damages by reducing number of Apoptotic cells in kidney, so it seems that using it can be effective for treatment in Diabetic Rat.

Key words: Apoptosis, Diabetic, Quercetin, Streptozotocin, kidney, Rat.

Introduction

Diabetes is a chronic disease that due to hyperglycemic. Hyperglycemic in long time have side effect in other tissues especially in liver. Due attention has been paid to the search of effective drugs in the field of traditional Chinese medicine (TCM).Diabetes mellitus is a group of syndromes characterized by hyperglycemia, altered metabolism of lipids, carbohydrates and proteins and an increased risk of complications from vascular diseases [3]. Enhanced oxidative stress and changes in antioxidant capacity are considered to play an important role in the pathogenesis of chronic diabetes mellitus [4,5]. Although the mechanisms underlying the alterations associated with diabetes mellitus are presently not well understood, hyperglycemia lead patients to increased oxidative stress because the production of several reducing sugars (through glycolysis and the polyol pathway) is enhanced [6]. These reducing sugars can easily react with lipids and proteins (nonenzymatic glycation reaction), increasing the production of reactive oxygen species (ROS) [6]. Diabetes is the most common endocrine disease that leads to metabolic abnormalities involving regulation of carbohydrate metabolism. In addition to imbalanced carbohydrate metabolism, yet another major concern in diabetes is increased oxidative stress.increased production of free radicals or ROS formation may induce oxidized LDL (Ox-LDL), which is key step in the sequence of events leading to atherosclerosis Sustained hyperglycemia and increased oxidative stress, are the major players in the development of secondary complications in diabetes. These abnormalities produce pathologies including vasculopathies, neuropathies, ophthalmopathies and nephropathies, among many other medical derangements [7]. The balance of ROS and antioxidant is a major mechanism in preventing damage by oxidative stress. Therefore, the dietary supplement of antioxidants such as vitamins, flavonoids has been used to prevent the occurrence of many chronic diseases [8]. Many herbal such as: Barberry, Estragon, Rhus coriaria, Cinnamomum...
zelanicum, Hypericum perforatum and onion known anti diabetic effects and use to patient treatment. Quercetin is a well-known flavonoid and a strong antioxidant and long-term treatment of STZ-diabetic animals and it has been shown to reduce oxidative stress [9] we plant to study the effect of Quercetin as a protective on kidney cells apoptosis.

Material and Methods

Animals:

Forty adult Wistar albino male rats were 8 weeks old and weighing 250±10g, they were obtained from animal facility of pasture institute of Iran. Male rats were housed in temperature controlled rooms (25°C) with constant humidity (40-70%) and 12h/12h light/dark cycle prior to use in experimental protocols. All animals were treated in accordance to the Principles of Laboratory Animal Care. The experimental protocol was approved by the Animal Ethical Committee in accordance with the guide for the care and use of laboratory animals prepared by Tabriz medical University. All Rats were fed a standard diet and water. The daily intake of animal water was monitored at least one week prior to start of treatments in order to determine the amount of water needed per experimental animal. Thereafter, the rats were randomly selected and divided into control (n=10) and Quercetin (QR) group that received 15mg/kg QR (IP), (n=10), and Diabetic group that received 55mg/kg (IP) streptozotocin (STZ) (n=20) which was subdivided to two groups of 10; STZ group and treatment group. Treatment group received 55mg/kg (IP) STZ plus15mg/kg QR (IP), the control group just received an equal volume of 1cc distilled water daily (IP). Diabetes was induced by a single intra peritoneal (I.P) injection of streptozotocin (STZ, Sigma- U.S.A.) in 0.1 M citrate buffer (pH 4.0) at a dose of 55 mg/kg body weight. Quercetin (QR) injections were continued to the end of the study (for 4 weeks), [12].

Induction of experimental type 1, Diabetes:

Experimental type 1 diabetes was induced in rats by intra peritoneal (I.P) injection of 55 mg/kg streptozotocin (STZ) in distilled water. Control rats were received distilled water, only.

Blood glucose determination:

Blood samples were collected from the tail vein. Basal glucose levels were determined prior to STZ injection, using an automated blood glucose analyzer (Glucometer Elite XL). Sample collections were then made 48 h after STZ injection and blood glucose concentrations were determined and compared between groups. Rats with blood glucose concentrations above 300 mg/dl were declared diabetic and were used in the experimental group.

One week after the induction of experimental diabetes, protocol was started.

Quercetin preparation:

Quercetin powder was obtained from Sigma Chemical Company (St. Louis, MO, USA). It was dissolved and diluted with 20% glycerol in 0.9% normal saline, mixed vigorously and stored in a dark bottle at 4°C. The quercetin solution was freshly prepared each week.

Surgical Procedure:

In the 28th day, (at the end of the treatment period), the rats were killed with diethyl ether, and kidney tissues in control & experimental groups were immediately removed.

TUNEL analysis of apoptosis:

The in-situ DNA fragmentation was visualized by TUNEL method [16]. Briefly, dewaxed tissue sections were predigested with 20 mg/ml proteinase K for 20 min and incubated in phosphate buffered saline solution (PBS) containing 3 % H2O2 for 10 min to block the endogenous peroxidase activity. The sections were incubated with the TUNEL reaction mixture, fluorescein-dUTP (in situ Cell Death Detection, POD kit, Roche, Germany), for 60 min at 37°C. The slides were then rinsed three times with PBS and incubated with secondary antifluorescein-POD-conjugate for 30 min. After washing three times in PBS, diaminobenzidine-H2O2 (DAB, Roche, Germany) chromogenic reaction was added on sections and counterstained with hematoxylin. As a control for method specificity, the step using the TUNEL reaction mixture was omitted in negative control serial sections, and nucleotide mixture in reaction buffer was used instead. Apoptotic cells were quantified by counting the number of TUNEL positive apoptotic cells per cross-section. Cross sections of 100 kidney tissues per specimen were assessed and the mean number of TUNEL positive apoptotic cells per cross-section was calculated.

Measurement of Serum Total Antioxidant capacity (TAS):

TAS was measured in serum by means of a commercial kit (Randox Co-England). The assay is based on the incubation of 2, 2'-azino-di-(3-ethylbenzthiazoline sulphonate) (ABTS) with a peroxidase (methmyoglobin) and hydrogen peroxide to produce the radical cation ABTS⁺, which has a relatively stable blue-green color, measured at 600 nm. The suppression of the color is compared with that of the Trolox, which is widely used as a traditional standard for TAS measurement assays,
and the assay results are expressed as Trolox equivalent (mmol/L), [14].

**Measurement of Serum MDA:**

Tissue MDA levels were determined by the thiobarbituric acid (TBA) method and expressed as nmol MDA formed/mL. Plasma MDA concentrations were determined with spectrophotometer. A calibration curve was prepared by using 1,1,3,3-tetramethoxypropane as the standard [15].

**Statistical analysis:**

Statistical analysis was done using the ANOVA and test for comparison of data in the control group with the experimental groups. The results were expressed as mean ± S.E.M (standard error of means). P-value less than 0.05 were considered significant and are written in the parentheses.

**Discussion and conclusion:**

Make use of onion and Quercetin in diabetic patient treatment has been experimented [17]. Investigations show onion and Quercetin decrease serum glucose level [18] but this reduction with onion has been significant [19]. Also Quercetin decreases oxidative stress and blood vessels damage in diabetic rats [20,21]. Other investigations show Quercetin increases the level of blood insulin and serum Ca²⁺ and Mg²⁺ [22]. Investigations show liver has an important role in carbohydrate metabolism since it is responsible for the balance of blood glucose level by means of glycogen sis and glycogenolysis therefore impaired hepatic function impairs metabolic homeostasis of glucose [2,3]. In the presence of impaired glucose metabolism and occurrence of hyperglycemia, genes involved in fatty acid storage were activated [4]. On the other hand, liver diseases can induce diabetes mellitus. This type of diabetes mellitus is clinically different from that of type II diabetes mellitus since it is less frequently associated with microangiopathy [22]. Insulin resistance occurs in muscular and adipose tissues combined with hyper insulinemia are pathophysiological bases of diabetes in liver disease [23]. The etiology of liver disease is important in the incidence of diabetes mellitus since non alcoholic fatty liver disease (NALFD), alcohol, hepatitis C virus (HCV) and hemachromatosis are frequently associated with diabetes mellitus (22). Investigations show liver tissue damage and apoptosis induced by diabetes mellitus increase active O₂ specious. Flavonoids as an antioxidant factor found in nutrient such as fruit, vegetables, tea and black burgundy grape [24]. Flavonoids value in daily mail varies from 16 mg to 1000 mg. Quercetin as an important grape [24]. Flavonoids as an antioxidant factor found in nutrient such as fruit, vegetables, tea and black burgundy grape [24]. Flavonoids value in daily mail varies from 16 mg to 1000 mg. Quercetin as an important...
oxidant capacity [30,31,32,33,34]. According our results it seems quercetin as an anti-oxidant can protection kidney cells from cell injury by modulating TAC and MDA in diabetic conditions, and it advise to using it in diabetes diseases.
